The automatic detection of both microaneurysms and hemorrhages in color fundus images is described and validated in this paper. The various such as Gaussian Mixture Model, the k-nearest neighbor and support vector machine (SVM), AdaBoost are accepted to be analyzed for classifying retinopathy lesions from non-lesions. SVM classifiers are found to be the classifiers for bright and red lesion categorization. This lesion classification problem deals with unstable data sets and SVM or mixture classifiers derived from SVM using more classification error due to the data imbalance. Diabetic retinopathy is a difficulty of diabetes that can lead to impairment of vision and even blindness. It is the most common cause of blindness in the working age population. DR can be manage using available treatments, which are effective if diagnosed early. Since DR is asymptomatic until late in the disease process, regular eye fundus examination is necessary to check any changes in the retina. The several ways in which image analysis helps to examine DR from colour fundus images of the human retina. In order to give contribution, the image enhancement, by which the contrast and the sharpness of the images are enhanced to reduce noise.</p> <p>Keywords: Fundus images, SVM, Diabetic retinopathy (DR), micro aneurysms (MA) and hemorrhages (HE) etc.</p> <p>References:</p> <ol style="list-style-type: none"> Nayak, J., Bhat, P.S., Acharya, R., Lim, C., Kagathi, M. It is based on identification, evaluation and management of risk in construction project. Finally, we provide the suggestion to avoid risk and how to rectify the following risk occurrence. That’s why we collected the data in Gantt chart from construction officials and also to receive the information about construction project by questionnaire. From that we analyses the risk by using software like primavera. The data collection is based on two suspects as government and private organization. Apart from that, we</p>	10-12
